

SCENARIO REPLAY™

In every field of public safety, users eventually need to reconstruct an incident. And proving who said what, to whom, and when is crucial. But it is not enough just to have a state-of-the-art voice and data recording platform and a generic replay facility.

NICE's Scenario Replay provides simple control of advanced recording technology, so all users can get the information they need for analysis, investigation, or evidence – quickly and simply.

NEW FLEXIBILITY AND EASE-OF-USE

Every user and every search is different. Scenario Replays multiple configurable views let users see the desired information in a format that works best for them:

- Graphical View shows how all transmissions took place relative to each other and when.
- List Window shows transmissions together with key data user needs.
- Properties Window shows all data associated with any selected transmission.

All the information and visual display anyone needs, any time, in one simple-to-use interface.

POWERFUL SEARCH CAPABILITIES

Scenario Replay provides simple yet extremely powerful search capabilities that reduce search times dramatically and minimize the use of valuable resources. Standard, Windows-based controls and user interfaces simplify operation and minimize training requirements. Users are freed from specifying which recorder to search; Scenario Replay searches all the recorders and channels which the user can access.

Six filters provide a simple way to narrow down search results. Filter drop-down menus are automatically populated with data from the search results, and users can select multiple values for each filter. Users can narrow down results to find the right transmissions with the minimum amount of effort.

For even more precise searches, the Advanced Search feature allows users to create searches by selecting any field in the database.

REPLAY AND DELIVER

After replay, saving and delivering transmissions is the next critical part of the chain of evidence.

Scenario Replay provides several options for saving, distributing, and importing scenarios. Users can save multiple transmissions as a single .wav file, or as with associated data as a complete scenario for later analysis on a standalone PC. Users can save and analyze specific scenarios without access to critical recording equipment. And all this is done using simple and intuitive replay controls.

FEATURES

- System-wide view of all calls, either list or graphical view, with call transmission information provide maximum flexibility.
- Search on any data available from the recorder, including date, time, duration, channel, user ID, radio talk group, radio ID, position or alias, or ANI/ALI data.
- Cascade searches using filters with multiple criteria to find the exact calls required with the minimum amount of effort.
- Search all system channels from one workstation, regardless of the number of recorders.
- Number of channels searched and replayed is only limited by recorder size.
- Both text and voice annotation to calls can be created and reviewed.
- Up to three configurable views for call display: by channel, by talk group, or by radio ID, and other customized views for specific needs.
- Multiple ANI/ALI records are recorded for a single call.
- Advanced integration with trunked radio systems to give graphic view of events, such as emergency call, grouping, busy unit, etc.
- Extensive online help reduces training resource requirements and enhances usability.
- Save search results as a scenario, with all transmissions and data, for later evaluation on a standalone PC.
- Replay transmissions from recorder, saved scenarios, or saved .wav file with configurable spoken date and time to satisfy statutory requirements.
- Advanced replay controls include automatic gain control, play markers to isolate a specific section, display of time and date of replayed call, configurable loop replay and more.
